File

larder.ttl
File

Create a knowledge graph based on the brainstorming results. Use the provided skill. Use larder.ttl as the starting point.

Worked for 1m 40s

Grow mode: I used `larder.ttl` as the existing graph and appended the brainstorm ingest without rewriting the starting statements, following the supplied skill's additive workflow and provenance rules. SKILL

The result contains 50 project nodes: 12 clusters and 38 ideas, connected by 49 `dkg:inCluster` edges. All 50 currently rest on this single brainstorm artifact, so there is no cross-artifact corroboration yet. No disconnected project nodes or contradictions were introduced. I also preserved visible spellings such as `Aller-genes` and `Authen-tication` rather than silently normalizing them, consistent with the skill's requirement to retain artifact spelling and provenance. SKILL

Download the complete knowledge-graph bundle

You can also access the individual outputs: Turtle knowledge graph,

ingest report and full merge ledger , and browsable view index . The generated Turtle parses successfully and contains 620 triples including the original vocabulary.

Ingest Business Model Canvas

Worked for 1m 18s

Business Model Canvas ingested in **grow mode**. The existing brainstorm graph was preserved and the BMC was appended additively, following the skill's rule not to rewrite existing statements during growth. SKILL

The BMC contributed **30 stickies: 29 new nodes and 1 auto-merge**. `Planner` was auto-merged with the existing brainstorm `Planner` node because it is an exact label match on the same spine class with no conflicting property. I added **8** `dkg:proposedSameAs` **links** for uncertain identities rather than collapsing them, including `Content Creation`, `Content Rating`, `Cooking Support`, `Recipe Search`, `Com-munity`, and `Chefs`. That follows the skill's requirement to propose rather than silently merge near matches or cross-spine matches. SKILL

The graph now has **79 project nodes; 78 of 79 still rest on only one artifact**, with `Planner` currently the sole node corroborated by both artifacts. Twenty-two BMC items remain structurally orphaned rather than being connected through invented canvas relationships. The resulting Turtle parses successfully, with no project nodes missing provenance or confidence.

Ingest Capability Map

Worked for 33s

Capability Map ingested in **grow mode**. The existing brainstorm and Business Model Canvas statements were preserved, and the Capability Map was appended as the third artifact, consistent with the skill's additive ingest rule. 

The map contributed **5 lane clusters** and **16 capability stickies**: 15 new capability nodes and 1 auto-merge. `Content Creation` merged with the BMC Key Activity of the same name because it is an exact-label match on the same `Capability` spine. I kept **15 identity links** as `dkg:proposedSameAs` where the wording, role, or granularity is not strong enough for an automatic merge. The graph now contains **99 project nodes**; 97 still rest on one artifact, while 2 carry provenance from multiple artifacts.

The explicit map classification was preserved as **Core = 5, Supporting = 5, Generic = 6**. Because the ontology has no dedicated capability-classification property, I retained these

classifications in each node's locator rather than inventing vocabulary. No project node is missing source or confidence, and the updated Turtle parses successfully with **953 triples**.

Ingest

Worked for 2m 14s

Impact Map ingested in **grow mode** after the brainstorm, Business Model Canvas, and Capability Map. Existing graph statements were preserved, in line with the skill's additive-growth rule. SKILL

This ingest added the first explicit measurable **Goal**, plus **9 actors**, **14 impacts**, and **16 deliverables**. There were **6 auto-merges**: `Kitchen ware retailer`, `Photo book service`, `Rating`, `Meal Chooser`, `Timer`, and `Cookbook publishing`. I kept **25 cross-artifact identity links as proposals** where labels, plurality, roles, or spine classes differ.

The graph now has **133 project nodes**. **125 of 133** still rest on a single artifact; 8 now have provenance from multiple artifacts. I emitted **8** `realises` **edges** where the impact→deliverable connection was visually unambiguous, such as `Nutrition requirement management → follows dietary plans → Goal` and `Paywall for premium content → see premium content → Goal`. I did **not** guess the densely crossing actor→impact lines or ambiguous remaining impact→deliverable lines; those are recorded as open questions, consistent with the skill's instruction not to invent edges. Ingest Wardley Map

Worked for 48s

Wardley Map ingested in **grow mode** after the brainstorm, Business Model Canvas, Capability Map, and Impact Map. Existing statements were preserved, consistent with the skill’s additive ingest workflow. SKILL

The Wardley ingest adds **4 user anchors, 7 user needs, and 24 components**. I recorded the components’ horizontal evolution placement as **6 Custom-built, 6 Product, and 12 Commodity**; none fall in Genesis. I did not emit numeric `dkg:visibility` values because the vertical axis is qualitative rather than numerically measured.

The graph now contains **165 project nodes**. **154 of 165** still rest on a single artifact, while 11 have provenance from multiple artifacts. This ingest includes **9 clear actor→need links, 14 need→component dependencies, 20 component→component dependencies, and 44 proposed identity links**. Exact same-label/same-spine matches such as `Young families`, `Singles`, and `Member Management` were merged where appropriate; ambiguous or cross-spine matches remain proposals, following the skill’s identity rules. SKILL

The final Turtle validates successfully with **1,501 triples**, with no project nodes missing source or confidence. Dense crossing dependency lines that could not be followed confidently were left as open questions rather than guessed.

Ingest Domain Stories

Worked for 38s

The five Domain Stories were ingested in **grow mode**, **one at a time** and in the **supplied order**, as required by the skill. Existing statements from the brainstorm, BMC, Capability Map, Impact Map, and Wardley Map were preserved.

SKILL

After all five stories, the graph contains **224 project nodes** and **2,219 triples**. The Domain Stories contributed **32 sentence nodes**, **11 story-sourced actors**, **16 story-sourced work objects**, and **22 proposed cross-artifact identity links**. There are **no Domain Story structural orphans**, and validation found **0 nodes missing source** and **0 nodes without exactly one confidence value**.

Corroboration increased incrementally: after Ask Chef, 16 nodes had multiple sources; after Ask Community and Competition it remained 16; after Grandma it rose to 17 and stayed there after Grandma II. Exact repeated labels within the Domain Story role were reused, while cross-role/near matches such as `Chef`, `Com-munity`, `Grandma Avatar`,

Meal, Competition, and Rating were retained as proposals rather than silently merged, following the skill's identity rules. SKILL

Ingest EventStorming

Worked for 1m 11s

EventStorming has been ingested in **grow mode**. The earlier brainstorm, BMC, Capability Map, Impact Map, Wardley Map, and five Domain Stories were left intact, consistent with the skill's additive workflow. SKILL

This ingest added **6 bounded contexts, 11 commands, 18 domain events, 5 actors, 11 read models, 8 aggregates, and 1 external system**. It also added **18 command→event triggers, 23 reads relationships, 13 `performedBy` links, 10 `actsOn` links, and 23 proposed identity links**. The graph now has **275 project nodes**; **255 of 275** still rest on a single artifact, while 20 have provenance from multiple artifacts.

The main new operational traces include `Register cook → Cook registered`, `Plan dinner → Dinner planned`, `Request help → Help requested`, `Provide help → Help provided`, `Substitute ingredients → Ingredients substituted`, `Take pictures → Pictures taken`, and `Provide thanks → Thanks given`. `Prepare meal` is reused across contexts and is linked to multiple visible outcomes, including `Meal planning stalled`, `Step unclear`, `Catastrophe happened`, `Meal rescued`, and `Meal prepared`.

I preserved labels such as `Com munity Cook`, `Help Response`, `plan settled`, and `Step competed` exactly as drawn. Ambiguous adjacency and repeated context boxes were not turned into invented chronology or extra causal edges. That follows the skill's rule that gaps and ambiguities should remain findings rather than being silently repaired. SKILL

The resulting Turtle validates successfully with **2,657 triples**, with **0 missing-source nodes, 0 confidence errors, and 0 EventStorming structural orphans**.

Ingest Visual Glossary

Worked for 1m 56s

Visual Glossary ingested in **grow mode**. The existing graph was preserved and the glossary was appended as the next artifact, consistent with the skill's additive-ingest rule.

SKILL

The glossary contributed **25 terms**, including **7 terms marked with the visible** `[+]` **symbol**, which I modelled as `dkg:AggregateRoot`, plus **30 reified glossary relationships**. Their verbs and cardinalities are preserved verbatim, including values such as `1`, `0..*`, `1..*`, `0..10`, `1..3`, and `1..10`, following the ontology's explicit cardinality pattern.

SKILL

There were **8 exact same-Concept auto-merges** and **15 proposed identity links**. The graph now contains **322 project nodes**; **297 of 322** still rest on a single artifact, while 25 have provenance from multiple artifacts. No Visual Glossary node is structurally orphaned.

New explicit vocabulary paths include `Dinner → has → Menu (1)`, `Menu → has → Course (1..*)`, `Recipe → contains → Ingredient (1..*)`, and `Recipe → contains → Step (1..*)`. The Help model is now considerably richer, with explicit relations among `Help Request`, `Help`, `Picture`, `Ingredient Substitute`, `Preparation Step Explanation`, `Steps to Mitigate Catastrophe`, and `Menu proposal`.

I did not guess the endpoints of several long crossing `belongs to` / `for` connectors whose targets are not visually unambiguous; those are recorded as open questions rather than fabricated edges, consistent with the skill's "never invent a node/edge" principle.

SKILL

The resulting Turtle parses successfully with **3,079 triples**, with **0 missing-source nodes** and **0 confidence errors**.

Download the updated knowledge graph

The new graph explicitly captures context integration paths such as `Recipe Catalog → Meal Planning` via synchronous `OHS`, `Meal Planning ↔ Cooking Assistance` via

synchronous `OHS` , and `Cooking Assistance ↔ Grandma Avatar AI` via asynchronous `ACL . Media → Sharing` and `Consent Management → Sharing` are also represented, with `CF` preserved exactly as written rather than expanded or interpreted.

The graph now contains **343 project nodes**. **295 of 343** still rest on a single artifact, while **48** have provenance from multiple artifacts. There are **0 Context Map structural orphans**, and validation found **0 missing-source nodes** and **0 confidence errors**. The resulting Turtle contains **3,341 triples**.
